

I CLAIM:

1. An anchor apparatus for temporarily immobilizing the feet of the support legs of a musical instrument stand wherein, the apparatus comprises
a base unit comprising a generally thin flat base member having a top surface and a bottom surface wherein, the bottom surface is further provided with a hooked portion; and,
a capture unit including a raised wall member projecting upwardly from the top surface of the base member wherein, the raised wall member is provided with a vertical opening dimensioned to receive the foot portion of a musical instrument stand.
2. The apparatus as in claim 1; wherein, the raised wall member is formed integrally with the base member.
3. The apparatus as in claim 1; wherein, the raised wall member has a generally C-shaped configuration.
4. The apparatus as in claim 1; wherein, the raised wall member has a front portion flanked by two generally straight opposed sidewall portions.
5. The apparatus as in claim 4; wherein, said front portion is curved.
